

929. Unique Email Addresses

```
1 class Solution:
2     def numUniqueEmails(self, emails: List[str]) -> int:
3         email_set = set()
4         for email in emails:
5             local_name, domain_name = email.split("@")
6             local_name = "".join(local_name.split('+')[0].split('.'))
7             email = local_name + '@' + domain_name
8             email_set.add(email)
9         return len(email_set)
```

实例

以下实例展示了join()的使用方法:

实例(Python 2.0+)

```
#!/usr/bin/python
# -*- coding: UTF-8 -*-

str = "-";
seq = ("a", "b", "c"); # 字符串序列
print str.join( seq );
```

以上实例输出结果如下:

```
a-b-c
```
